

Gene: Ly6g

Colony prefix: DARF

Allele: *Ly6g^{em1(IMPC)Wtsi}*

Allele type: Crispr/Cas9 mediated deletion

Anticipated mutation: More than 50% CDS deleted

Allele information:

Further information about the allele can be found on the 'International Mouse Phenotyping Consortium' (IMPC) web site at <http://www.mousephenotype.org>

Genotyping by end-point PCR

These mice may be genotyped through a combination of separate PCR reactions that detect the gene-specific wild type allele and a mutant allele-specific short range PCR. Interpretation of the consolidated results produces the genotype of the mice. In addition to the expected product, the mutant assay may also amplify the endogenous wild type sequence which will appear as a larger band on an agarose gel. The presence of this extra band will depend on the size of the original deletion.
